# 1.0 Using the additional fields

The new functions of the additional fields can now be used in Control Center as well as in the iOS app and web tester.

The additional fields per test can be configured separately for planners and testers.

When configuring a test, the planner can also assign additional fields for the tester, which can later be answered in the iOS app or web tester.

These additional fields allow the tester to quickly enter additional and more precise information in the feedback.

Any number of fields can also be added during the evaluation phase using the attributes from the master data. This allows the planner to add and receive additional information when evaluating a test. The additional fields are displayed in separate columns in the feedback validation.
