# 2.0 Additional fields for planners and testers per test

It is now possible to configure the additional attributes for planners and testers for each test.

Additional input fields have been introduced so that the planner can receive additional information when evaluating a test. These fields are generated based on the attributes and can be implemented individually.

Attribute fields have also been set up for testers, allowing them to quickly provide additional and more detailed information in feedback.

These additional attributes are then displayed in separate columns in the evaluation and then feedback validation. The tester attributes are displayed directly after the mandatory information (such as test object name, test object key number, time, tester, category and rating) and are separated from planner attributes by an icon.

A detailed description can be found here: LINK to the manual
