2.0 Tester role in master data is now conditionally editable

The automatic synchronization of users under “administration” and the testers in "master data", as well as their e-mail addresses, has been optimized.

If a new tester is created under “master data” for a specific division, he is also automatically created as a new user under “administration” in exactly this division with the role "Tester".

If a new user is created under “administration” and at the same time authorized as a tester for a specific division, the tester is automatically added to the corresponding division under "Master data" in this case too.

The planner, the administrator and anyone who has organizer roles, can create a "New tester" under "Master data" in the "Tester overview" submenu and configure the following settings:

1. Determine username
2. Enter e-mail address

3. Via the toggle create a
    1. user account with login -> then the checkbox "Role tester in an division" is automatically selected and cannot be changed
    2. choose to not create a user account with login
4. "Archive" or
5. "Delete" if no tester results are available

From now on, when editing the testers in "Tester Details", he may only deselect the checkbox "Role tester in a division" and "Archive" but not make any changes to the basic data. For changes of: Last name, first name, e-mail and company only the administrator is authorized. Only an administrator can deactivate users.

A planner cannot deselect the checkbox "Role tester for <division>" for a tester who has already been created as a tester but is not yet a user. He can only generate an account and a role.

In the future if an existing user is edited, changes to the first name, surname and department will also be automatically updated in the linked tester tables.
